PixSort — ICP Brief

April 2026 · Based on 10 customer conversations · Hypothesis for co-founder review

THE CORE HYPOTHESIS

We've been talking to a wider-than-ideal group. Most people we've spoken to validate that the problem exists — but they won't pay to solve it. The people who will pay are a specific subset: **iPhone-first creators who monetize their content, especially those with editors in the loop.**

Key clarification: **we sort your camera roll, not an SD card.** This is an iPhone-native solution for creators living on their phone.

PRIMARY ICP

Will Pay · Acute Pain · Editor Use Case

Who they are

- **UGC creators** with multiple brand clients — multiple content categories on one phone, already paying for tools that speed up their workflow
- **Business owners who create content** and have outsourced editing — can't hand a messy camera roll to an editor, so organized files are a business requirement
- **Lifestyle / day-in-the-life creators** — shooting across categories (food, travel, fitness, product) and needing to find specific clips fast

What makes them ICP

- Time is money — an hour saved finding clips is real, measurable ROI
- Already paying for other creator tools — $9.99/month is easy math when content is income
- Have an editor or are actively building toward one — the file-sharing pain is acute, not theoretical
- Shoot across multiple content categories — the chaos compounds fast

---

SECONDARY ICP

Will Pay Eventually · Growing Pain · Pre-Editor Stage

Who they are

- iPhone-first creators building toward monetization — 10K–100K followers
- Not yet using editors but accumulating content fast

- Feel the pain acutely, haven't built a workaround yet
- PixSort is the moment they get serious about their workflow

---

NOT ICP

Validated Problem · Won't Pay

- **Event photographers / DJs** — recency-first workflow, always pulling from the last shoot, no backlog problem
- **Agency social media managers** — don't own the camera roll, content comes from clients
- **Desktop-first organizers** (e.g. Google Drive users) — have already built a manual system they're comfortable with
- **Casual users without a content business** — feel the pain but won't pay ($5/mo ceiling)
- **SD card / camera-first shooters** — different device, different workflow

> **The filter question:** "Do you shoot multiple types of content on your iPhone and need to find specific clips later?"
> Yes + frustrated = ICP · Yes + has a working workaround = maybe · Event-only / no = not ICP

PAIN POINTS — FROM CUSTOMER CONVERSATIONS

The Pain	Source
Camera roll has thousands of photos — finding one specific clip means scrolling for 30–60+ minutes	Jaylin, Tiffany, Carlos, Sayu's clients
Can't share raw camera roll with editor — have to manually organize albums first, which falls apart over time	Carlos (independent), Tiffany (origin story)
Phone storage maxed out — too many videos accumulated, can't film new content	Jaylin, multiple others
1–3 hours of a video's production time is just finding the clips	Jaylin, Sayu (clients)
Starting to organize is paralyzing — no one knows where to begin	Emma ("paralyzing"), multiple
Manually created albums fall apart — 6 months later you're back to square one	Tiffany's origin

85% of creators have this problem but don't consciously recognize it — they've normalized scrolling	Jaylin (unprompted)
Editors drop disorganized creators as clients entirely — reorganized their whole business around it	Sayu (changed agency model to avoid lifestyle creators)

THE WOUND → DREAM STATE

Where they are now	Where PixSort takes them
Scrolling through 10K+ photos to find one clip	Search any keyword, find it in seconds
Manually prepping camera roll before every editor session	Share sorted albums instantly, anytime
Phone full — can't film without deleting first	Storage reclaimed, always ready to capture
Content production takes 3 hours instead of 15 minutes	10x faster editing flow = more content = more income
Chaos → paralysis → less content posted	Organized library → momentum → consistent output
